

Final stage of DVR installation

Once all the CCTV kit has been installed, Now the Important stage is to check the recording on the DVR

Take the vehicle out for a test run to get some footage

Using the correct software for the DVR

Connect the HDD or SD card and run the software to make sure it has recorded properly

Once you have confirmed the unit is recording correctly you will need to set a schedule to check the unit is still recording correctly and backing up the recordings onto a separate storage device to keep safe

Then reformat the unit's storage and reinstall

Usually, the DVR will overwrite the oldest data first unless it has any stored locked files which will not be overwritten which overtime could fill the HDD or SD card which will mean after a long time the unit will not record anymore until the locked files are backed up externally and the storage has been formatted.

As unfortunately if the storage becomes full and not recording there will be no way to get any data if needed.
