

### Additional Location Details for BSIS Camera

Following testing we can give some additional details as to the location for fixing the BSIS camera on the side of the vehicle.

The primary location that is recommended is the bright yellow section in the picture above with a minimum height of 2.2m up to a max of 3.0m and between 0m and 2.0m from the front of the vehicle. This gives the optimum location for view and calibration.

If this is not possible then an additional area, shown in pale yellow, up to 3.5m in height and up to 4.0m from the front of the vehicle can be used for the camera. The minimum height remains at 2.2m.

The entire blind spot area as shown in the installation instructions must be covered by the image from the camera.
